PAPER PROTOTYPE

We tested our paper prototype on Austin, a college student living in his own apartment. His first instinct was to press "Let's Start".

On the next screen: the user proceeded to enter their name and click "Add Photo" to upload a profile photo. Austin was unsure whether the "Location" and "Age" boxes were buttons with a drop down menu or a text box to click. An optimized search engine would be ideal for filling out this information.

After filling out the form, the user was given the top second to right screen on the image above. The user immediately clicked the plus sign to "Add a house". They then saw their house built with the option to add housemates. The user was confused if housemates meant other users/friends. Clarifying that housemate,

users, and friends were all the same thing would clear up this confusion for the first time user setting up their profiles.

Austin was finally brought to the main homepage where he could input different chores. He loved the Randomize button at the end because it lessened the pressure of being the instigator.
